14. Emulsions in petroleum industry and ways of combating them. W. Kisielow. Nafta (Krakow), 1952, 8, 302-7, 325-31.  
--Emulsions are unwanted in unfinished product and crude, but many finished products must have the property of easy emulsification. Crudes agitated by production occlude brines which corrode equipment. Water has relatively high sp. vol. of vapour and high sp. ht. of vaporization, which interfere with space and heating economy. Suspended solids cause erosion. Author describes physical causes of emulsion formation and the mol mechanism involved, then mentions cases found in nature when crude is produced from the well. Methods of breaking emulsions are described, and Soviet chemicals are listed. Emulsions formed during acid and alkali refining are described next. They are mostly oil in aq phase, but methods of breaking them are similar to those of aq in oily phases. Initial alkali wash will remove naphthene acids and compounds of S even before dist. Various alternatives to  $H_2SO_4$  refining are given.

1110 Petroleum and natural gas as source of petrochemicals

A. Introduction

1. The petrochemical industry is one of the most important

2. in the world economy. It provides the raw materials for

3. a wide variety of products, including plastics, fertilizers,

4. and many other chemicals. The industry is also a major

5. source of employment and revenue for many countries.

6. The petrochemical industry is a highly competitive

7. industry, and it is subject to a number of risks, including

8. fluctuations in oil prices, changes in government policy,

9. and environmental concerns. The industry is also a

10. major source of pollution and environmental degradation.

their Occurrence in the Ashes of Polish Crudes

665 314

Mineralogical Institute, Polish Academy of Sciences, Warsaw, Poland. No. 11, 1963, pp. 1-10.

Using modern techniques, the composition of fourteen Polish crude oils was investigated and determination made of incidence in the particular elements covered by the following table.

Table 1. Ash content of the elements in the crude oils.

The elements of all the crudes were as follows: iron, vanadium, nickel, silicon, aluminum and manganese. Traces of other elements were found only in certain of the ashes.

The occurrence of vanadium and nickel in all the ashes is in accordance with the degree of incidence reported for these elements by the fact which indicates their special significance in the production of petroleum.

TITLE: Electroluminescence of bulk ZnS crystals /Report, Fourteenth Conference on Luminescence held in Riga, 16-23 September 1965/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 4, 1966, 628-632

TOPIC TAGS: electroluminescence, zinc sulfide, semiconducting material, luminophor, single crystal, single crystal growth

ABSTRACT: The study was undertaken in view of the growing interest in II-VI semiconductors as representatives of the class of compounds with a broad forbidden band. Zinc sulfide belongs in this category and is the most thoroughly studied electroluminophor. However, most previous investigations of this electroluminophor did not satisfy the basic conditions for electric measurements on semiconductors: absence of surface effects and adequate uniformity of the specimens. For the present work the single crystals were grown from a melt in an inert gas by the Stockbarger technique; the crystallization was realized at 1850° C to insure growth of hexagonal specimens. A characteristic of the single crystals was pronounced cleavage along the (1120) planes. The single crystals were up to 30 mm in diameter and 100 mm long. Chemical analysis

Card 1/2

L 39773-66

ACC NR: AP6013068

showed that the crystals contained the following impurities: Cu about  $10^{-4}\%$ , Ni about  $5 \times 10^{-6}\%$ , Fe about  $10^{-4}\%$ , Mn about  $5 \times 10^{-6}\%$ ,  $SO_4^{2-}$  under  $10^{-4}\%$ , and oxides under  $10^{-4}\%$ . The specimen plates were prepared as follows: the crystals were first oriented with reference to the cleavage plane and then wafers measuring  $3 \times 3$  mm and 2 mm thick were cut by means of a corundum disk. The wafers were etched in acid and provided with ohmic contacts to eliminate surface effects. In the experiments measures were taken to minimize heating; these consisted in providing good heat conduction and using short exciting pulses (1.7 microsec) and a very low duty factor. The electroluminescence peaks at about 460 mμ; the brightness is a linear function of the applied voltage. Further data are given on the ultraviolet electroluminescence spectrum of purer crystals. The experimental results are discussed in general terms; the emission is attributed to interband recombination. In conclusion, we desire to thank M.V.Fok for discussion of the results and valuable suggestions in the course of the work, V.K.Kostin for assistance in preparing the crystals, and A.N.Savin and G.G.Stolpovskiy for help in adjusting the electronic equipment. TITLE: Acoustoelectric interaction in hexagonal zinc sulfide

SOURCE: Fizika tverdogo tela, v. 8, no. 3, 1966, 805-808

TOPIC TAGS: zinc sulfide, semiconductor carrier, semiconductor conductivity, piezoelectric property, acoustic speed, dielectric constant, photoeffect, electron mobility

ABSTRACT: For the purpose of determining the interaction between sound waves and free carriers in semiconductors of the  $A^{II}B^{VI}$  type, which have piezoelectric properties, the authors determined the coefficients of electromechanical coupling ( $K_{33}$  and  $K_{15}$ ), the speed of sound of the longitudinal waves along the optical axis, and the speed of the shear waves in a direction perpendicular to the optical axis)

Card 1/3

LA 23023-66

ACC NR: AP60C9665

in single crystals of  $\alpha$ -ZnS grown from the melt in an argon atmosphere under pressure. They investigated the electron absorption and the acoustoelectric effect as functions of the intensity and spectral composition of illumination applied to the crystal. The dark damping of the longitudinal waves along the c axis and of the shear waves in a direction perpendicular to it were found to be 0.35 db/cm and 0.50 db/cm, respectively. The values obtained for  $K_{33}$ ,  $K_{15}$  were 0.127 and 0.054 respectively, for  $d_{33}$  and  $d_{15}$  the values were 9.7 and  $-8.4 \times 10^{-8}$  cm/statvolt. The dielectric constant was 8.7 in both directions. The longitudinal and transverse velocities by both the pulsed and the resonance method were  $5.92 \times 10^{-5}$  and  $2.68 (2.67) \times 10^{-5}$  cm/sec, respectively. The electron absorption was almost linear with the applied illumination. With changing illumination intensity, the average acoustoelectric field exhibits a plateau, which is in satisfactory agreement with the theory. The acoustoelectric voltage had a variation similar to the electron absorption. The investigated  $\alpha$ -ZnS crystals were found to have n-type conductivity, with approximate electron mobility  $80 \text{ cm}^2/\text{sec-v}$ . The results are in agreement

TITLE: Preparation of rare earth activated zinc sulfide single crystals /Report, Fourteenth All-Union Conference on Luminescence (Crystal Phosphors) held at Riga, 16-23 Sept. 1965/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no.9, 1966, 1500-1503

TOPIC TAGS: luminescent crystal, ~~single crystal~~, zinc sulfide, thulium, luminescence center, *SINGLE CRYSTAL GROWING*

ABSTRACT: The authors prepared thulium-activated zinc sulfide single crystals and studied their luminescence. The investigations were undertaken mainly to develop a technique for preparing rare earth activated zinc sulfide single crystal phosphors. Hexagonal zinc sulfide single crystals with lengths of up to 10 cm and diameters of up to 3 cm were grown in a graphite crucible at 1800° in an argon atmosphere at a pressure of 200 atm by the technique described elsewhere by L.A.Sysoyev and N.M. Kraynyukov (Fizika tverdogo tela, 4, 3, 807 (1962)). Crystals grown from a mix containing 0.01% of thulium by weight exhibited thulium luminescence only after heating in a stream of H<sub>2</sub>S, which treatment produces zinc vacancies. Heating the crystals in a stream of NH<sub>3</sub>, which does not produce zinc vacancies, did not give rise to thulium

Card 1/2

ACC NR: AP7004984

luminescence. The relative intensities of the three main thulium luminescence bands varied with variations in the wavelength of the stimulating radiation and in the duration of the  $H_2S$  treatment; from this it is concluded that there are two different kinds of thulium luminescence centers. By breaking a crystal that had been heated in  $H_2S$  for 1.5 hour it was found that uniform activation of the 0.5 mm thick crystal had been achieved. Single crystal  $ZnS:Tm$  phosphors were also produced by heating  $ZnS$  single crystals in the mixture that is usually employed for preparing  $ZnS:Tm$  powder phosphors. The luminescence spectrum of these crystals was practically identical with that of  $ZnS:Tm$  powder phosphors. Orig. art. has: 3 figures and 1 table.

TITLE: Improved Process for Obtaining Alcohols by the  
Oxo-synthesis Method With Suspended Catalyst

PERIODICAL: Khimiya i tekhnologiya topliv i masel, 1961, 6  
No. 8, pp. 19 - 24

TEXT: The authors mention briefly the drawbacks of the existing technological schemes for obtaining alcohols by oxo-synthesis. The main drawbacks of the scheme with suspended catalyst are the erosion of the throttle elements, the need for paste pumps for transporting the catalyst (which is in suspension in the liquid) and the existence of a filtering section which work intermittently. Periodic switching between gas and liquid streams, a complicated automatic control and the decomposition of the cobalt carbonyl (decobal-tisation) are the chief drawbacks of the other two schemes. The present paper deals with improving the scheme with sus-pended catalyst. The tests were carried out on a model and in a pilot plant. In the present process the synthesis occurs  
Card 1/4

Improved Process ....

S/065/61/000/008/004/009  
E030/E355

in the liquid phase and therefore a solvent is used which is isobutyl alcohol at the start of the reaction, changing to the final product as the reaction proceeds. In the laboratory tests a propane-propylene feedstock with 74 to 85% propylene was used, the ratio of raw material to solvent being nearly 1:2 and that of CO to hydrogen 1:1.2. In the pilot plant, synthesis gas was used as feed, with the ratio of hydrogen to carbon monoxide varying between 0.5:1 to 7.5:1, the other parameters being nearly the same as those in the laboratory tests. In order to eliminate the deficiency in the filter system, a re-cycle system using a centrifugal separator was introduced. This system (developed in conjunction with NIIKhimMASH under the direction of Senior Engineer G.K.Ivanova) enables the filters to work for long periods without cleansing and, by returning the catalyst-rich fraction to the reactor, diminishes the quantity of product going for decobaltisation, filtering, hydrogenization and rectification. Thus, the process of obtaining butyl alcohol is carried out in three stages: 1) production of cobalt carbonyls and hydroformylation of propylene; 2) decomposition of cobalt carbonyls

Card 2/4

Improved Process ....

(decobaltization) and 3) hydrogenization of aldehydes and alcohols. In the previous two-stage process only alcohols were obtained as the final product; in the present three-stage one aldehydes also are obtained. It has been shown that by hydroformylation at 300 atm. and 125 °C the content of n-aldehydes in the final product increases. It has also been found that at temperatures of 110 to 140 °C and pressures of 25 to 100 atm the catalyst decomposes completely. At 135 °C and 300 atm. propylene converts to n-aldehydes (63%), iso-aldehydes (21%), high aldehydes (11.4%) and by-products (4%), the ratio of n- to iso-aldehydes being 3:1. With decreasing pressures this ratio decreases, being 2.2:1 at 250 atm. and 1.6:1 at 200 atm. During the oxo-reaction carried out in the pilot plant at temperatures between 135 and 160 °C, a pressure of synthesis gas of 180-200 atm., content of catalyst of 1-2% and contact time 45 min., a product with a ratio of n- to iso-aldehydes of approximately 2:1 was obtained. This product hydrogenated in a mixture of butyl alcohols in the same ratio. G.N. Klinova, A.D. Yerosheyeva, N.M. Malygina, A.I. Khokhlov, A.I. Zaytseva, T.V. Yelisova and A.I. Busygina

TITLE:

Investigation of the physical characteristics of the lattice  
of a uranium - graphite reactor by means of a subcritical  
insert

PERIODICAL:

Atomnaya energiya, v. 11, no. 1, 1961, 5-11

TEXT: This paper gives a description of the experiments carried out since  
the beginning of 1958 to investigate the physical characteristics of the  
lattice of a uranium-graphite reactor by means of a subcritical insert.  
A quadratic lattice (period 200 mm) was studied; the graphite block was 2.2m  
high and had a diameter of 4 m; its holes had diameters of 44 or 75 mm  
depending on the uranium rods used. Above and below were reflectors, 60 cm  
thick; the dimensions of the side-reflector could be varied according to  
the composition of the core. The inner and the outer parts of the core

Investigation of the ...

were different: The inner part had always rods of 2%-enriched uranium, and the outer one the subcritical insert as a part of the lattice of the reactor studied. The rods of the natural as well as the 2%-enriched uranium were 1 m long. To measure the lattice parameters of a reactor of the type Beloyarskaya GRES (Beloyarsk State Regional Electric Power Plant) ring-shaped sections (1 m long) of the fuel element (up to 1.2 % enriched uranium) simulating the real elements were built in the subcritical insert. Each fuel element channel contained six such elements arranged round a central tube. The reactor of the GRES also had vaporization and steam-superheating channels; these were simulated by having the central tube filled with water for the former, and having it without water for the latter. The characteristics of the systems studied were as follows:

Investigation of the ...

In order to be able to measure the neutron characteristics with the subcritical insert the neutron spectrum in the central part of the insert must be representative of the reactor. This is accomplished by a suitable choice of the dimensions of the insert, and it is verified by measuring the cadmium ratio or the relative density of the thermal and resonance neutrons. The spectrum of the thermal neutrons in the center of the insert as depending on the dimensions of the insert was determined by measuring the neutron temperature according to one of the following methods depending: boron filter method, filter method, direct measurement by means of a monochromator. The neutron temperatures for the insert of 13 and 25 rods were found to be 370 $\pm$ 15 $^{\circ}$ K (first method), and 346 $^{\circ}$ K and 318 $^{\circ}$ K (third method). Also, the resonance escape probability in U<sup>238</sup> ( $\phi$ ), the fast fission factor ( $\mu$ ), and the thermal utilization factor ( $k$ ) as well as the cadmium ratio  $R_{Cd}^1$  for U<sup>235</sup> ( $R_{Cd}^2$  for Cd), for copper ( $R_{Cd}^{Cu}$ ) and for gold ( $R_{Cd}^{Au}$ ) were determined. The results are given in Table 3. The results of the experimental and theoretical determinations of  $\mu$  are the following:

Card 4/8

25372  
S/089/61/011/001/001/010  
B102/B214

Investigation of the ...

Position of the channel	Value of $\mu$	
	experimental	theoretical
Central channel of an insert of 21 channels with water	1.040±0.006	1.033
One channel with water in the center of a thermal graphite column of 70 cm diameter	1.036±0.005	1.030
Central channel of an insert of 21 channels without water	1.042±0.006	1.035

$\phi$  for the GRES type reactor was found to be 0.64 (for channel with water) and 0.65 (without water). It was found that, in order to adjust the neutron spectrum in the center of the subcritical insert so that it is characteristic of the given uranium - graphite lattice, it is necessary so to choose the dimensions of the insert so that its equivalent radius is

$\sim 3(\sqrt{\tau + L^2})$  cm ( $\sqrt{\tau}$  is the slowing down length in the moderator and  $L$  the diffusion length). To measure  $\mu$  it is sufficient to arrange one cell of the lattice under study in the center of the reactor with 2% enriched uranium. The authors thank Ye. F. Makarov, G. M. Vladykov, G. I. Sidorov,

TITLE:

Screening effect of  $U^{238}$  resonances on  $U^{235}$ -resonance absorption

PERIODICAL: Atomnaya energiya, v. 13, no. 5, 1962, 435-439

TEXT: The problem of the mutual influence of neutron resonance absorption by  $U^{238}$  and by  $U^{235}$  inside the fuel lump where resonance absorption can be considered as volume absorption, is treated both theoretically and practically. This problem is important for elements operating with natural or enriched uranium because the  $U^{238}$  resonance levels are near those of  $U^{235}$  and the  $U^{238}$  absorption cross sections are larger than those of  $U^{235}$ . For fuel with the enrichment  $x$  the effective resonance integral

$$I_{eff}^{(x)} = \int \frac{\sigma_a^0 \sigma_a}{\sigma_a^0 + \sigma_a^1 x + \sum_i \sigma_{ai}^1 (1-x)} \frac{dE}{E},$$

(3)

Card 1/3

Screening effect of  $U^{238}$  resonances on ...

S/089/62/013/005/001/012  
B102/B104

can be represented by

$$I_{\phi\phi}^{(5)} = \sigma_0 \sigma_s \int_E \frac{\frac{1}{1 + \left(\frac{E-E_0}{\frac{\Gamma}{2}}\right)^2} \frac{dE}{E}}{\sigma_0 + \left[ \frac{\sigma_0}{1 + \left(\frac{E-E_0}{\frac{\Gamma}{2}}\right)^2} \left(1 + \frac{\Gamma_n + \Gamma_x}{\Gamma_y}\right) x \right] + \left[ \sum_i \frac{\sigma_{0i}}{1 + \left(\frac{E-E_{0i}}{\frac{\Gamma_i}{2}}\right)^2} \left(1 + \frac{\Gamma_{ni}}{\Gamma_{xi}}\right) (1-x) \right]} \quad (4)$$

using the Breit-Wigner formula and allowing for the neutrons absorbed by  $U^{238}$ . Summation is made over all  $U^{238}$  levels influencing the  $U^{235}$ -neutron absorption.  $\sigma_0 = \sigma_a + \sigma_s + \sigma_f$  is the sum of resonance absorption, resonance scattering, and fission cross sections,  $\sigma_s$  is the potential scattering cross section, the superscripts 5 and 8 refer to  $U^{235}$  and  $U^{238}$ .

TITLE: The anodic behavior of tungsten in alkaline electrolytes  
PERIODICAL: Zhurnal prikladnoy khimii, v. 35, no. 10, 1962, 2276-2281

TEXT: The effects of anodic current density ( $D$ ) and electrolyte composition and temperature on the anodic current efficiency ( $\eta$ ), were studied, owing to the absence of reliable data regarding these points, using NaOH, KOH, Na and ammonium phosphates,  $\text{Na}_2\text{CO}_3$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{NH}_4\text{OH}$  and also borates, tungstates, bicarbonates, etc., at 25, 50 and 80°C, with  $D$  varying from 1 to 1.0 a/cm<sup>2</sup>. The cell contained a (practically insoluble) Ni cathode, and 1 - 1.5 mm diameter, 40 - 60 mm long, 99.9% W wires were used as the anode. In strongly alkaline electrolytes ( $\text{pH} > 12$ ),  $\eta$  was practically independent of  $D$ , electrolyte concentration (1 - 30% NaOH) and temperature, and varied between 96 and 108%. The behavior of the W surface for various com-

Card 1/2

binations of temperature, D and % electrolyte is described, in graphical and tabular forms; in general good polishing was observed at low (up to ~15%) concentrations of electrolyte, the optimum concentration being ~ 0.25 N OH<sup>-</sup>. In weakly alkaline electrolytes (pH 7 - 12),  $\eta$  increased from 29.5% at 0.1 a/cm<sup>2</sup> and 18 - 20 v to 67% at 3 a/cm<sup>2</sup> and 70 v, and the formation of difficulty soluble, multicolored oxide coatings was observed on the W anodes. It is considered that weakly alkaline electrolytes, in the pH range of 7 - 12, are thus unsuitable for the industrial polishing of W. There are 2 figures and 3 tables.

fabrik)

PERIODICAL: Vrachebn. delo, 1957, Nr 1, pp 71-74

ABSTRACT: The working conditions of sintering-plant labor are examined.  
The following recommendations are made to improve the working  
conditions: complete closing off of the working portion of the  
sintering chain by a heat insulating jacket, the intake of air  
needed for sintering to be from the tail end of the belt covering  
and from the swinging spout; special devices for feeding and  
transporting the dust; provision of a centralized suction system  
for the removal of dust; provision of complete heat insulation,  
screening, and installation of water jackets to bring the tem-  
perature of the outer surfaces of the equipment for gas removal  
and the return fines cycle to 28°.

TITLE: Investigation of internal stresses in adhesive bonds

SOURCE: Plasticheskiye massy\*, no. 1, 1964, 57-59

TOPIC TAGS: adhesives, adhesive bond, coating, epoxy resins,  
phenolepoxy resins, glass-to-aluminum adhesion, glass-to-glass ad-  
hesion, adhesive bond internal stress

ABSTRACT: The internal stresses in adhesive bonds are much greater  
than in coatings due to the increase in the contact area of the bond-  
ing agent with the substrate (number of aggregation centers). In  
both coating and bond the internal stresses in the adhesive bond in-  
crease linearly with increasing thickness, but the bonding strength  
decreases. It was established that the bonding strength (adhesion)  
between the bond and the surfaces to be united, exerts a great in-

Card 1/2

ACCESSION NR: AP4009836

fluence on the size of inner stresses in the adhesive bonds, as well as in coatings. The kinetic expansion and relaxation of internal stresses in adhesive bonds and coatings are plotted for polyester bonds, phenolepoxy and epoxy resins. The kinetics of inner stresses in bonds and coatings from phenolepoxide adhesive for glass-to-glass and glass-to-aluminum is studied. The distribution of stresses, the data of internal stresses and bonding strength are plotted against film thickness. Orig. art. has: 5 figures.

TITLE: Production of thin-walled pipes of galvanoplastics

CITED SOURCE: Sb. Proiz-vo trub. Vy\*p. 10. M., Metallurgizdat, 1963, 101-105

TOPIC TAGS: thin walled pipe, galvanoplastic, pipe production

TRANSLATION: Possibility was studied of obtaining (by method of galvanoplastics) special thin-walled pipes (with thickness of wall  $< 0.1$  mm) from Cu, Ni, and also alloy of type 18-8. Two variants of constructions of installations for galvanoplastic manufacture of pipes were tested. On first variant it was proposed to increase metal on mandrel of finite length, and then for equal intervals of time to pull pipe from mandrel for several centimeters and on liberated part of it again to

Card 1/3

ACCESSION NR: AR4041594

ments conducted for the purpose of establishment of the possibility of obtaining special thin-walled pipes of alloy of type 18-8, in all tested electrolytes we could not make the layer of precipitated alloy greater than  $6 \mu$ . All obtained deposits were stressed with small yield on current. Only with use of electrolyte of composition 290 g/l of  $\text{Cr}_2 \cdot (\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$ , 39 g/l  $(\text{NH}_4)_2\text{SO}_4 \cdot \text{FeSO}_4 \cdot 6\text{H}_2\text{O}$ , 70 g/l  $\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$ , 100 g/l  $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$  and 50 g/l of Na citrate trisubstituted at acidity 1.6, the thickness of metal precipitated on mandrel exceeded  $10 \mu$ . Deposits with this thickness were nonporous, little stressed, but with thickness of  $15 \mu$  their internal stresses sharply increased and they spontaneously cracked. Bibliography: 16 references.

TITLE: On the Measuring of Electrode Polarization (Ob izmerenii elektrodnoy polyarizatsii)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Khimiya i khimicheskaya tekhnologiya, 1958, Nr 6, pp 79-83 (USSR)

ABSTRACT: The irreproducible results on electrode polarization (Refs 1, 2) are conditioned by several factors. Various suggestions have been made for their elimination (Refs 2-5). However, scientific publications do not contain any well-founded experimental data concerning the economical choice of electrode size, shape etc. The paper under consideration serves the purpose of establishing experimentally the electrode shape to be chosen, the angle at which the tip of the electrolytic key should be fixed with regard to the electrode, and finally the maximum current densities permissible at which reproducible results on polarization measuring at this or that position of said tip can still be obtained. In the experimental part, table 1 gives the characteristics of the cathodes used (of

and discoid). Figure 1 shows the design of a screening frame for the discoid cathode. Figure 2 illustrates the position of the tip of the electrolytic key. From figure 3 it can be seen that the extension from 0.1 to 1.7 mm of the capillary diameter (Fig 2, position 1) results in a potential-increase with rising current density (Curves 3 and 1). Figures 4, 5 and 7 show the cathode potentials with individual electrode types. Figure 6 shows a turnable plate for electrode, which turned out to be inapplicable to the purpose. A rotating disc must be used, the potentials of which are identical at different points. For their experiments the authors used the electrolytic precipitation of nickel from sulfates, of zinc from zincates, and of hydrogen from 6N NaOH. The most easily reproducible results are obtained on the measuring of potentials at all points of the cathode, with a sphere and a small disc enclosed in a vinyl-plast frame so as to eliminate an uneven current distribution. The tip of the electrolytic key must be directed towards the electrode from below, at an angle of 60-65°. There are 7 figures, 1 table, and 10 references, 6 of which are Soviet.

Construction of underground structures (Stroitel'stvo podzemnykh sooruzheniy)  
 Moscow. Izd-vo "Nedra", 1966. 293 p. illus., biblio. 2450 copies printed.

TOPIC TAGS: Construction , mining engineering

PURPOSE AND COVERAGE: This book is intended for engineering and technical workers of construction, scientific-research, and design organizations studying the problems of building underground installations; it can also be used by workers of mine-construction organizations. In the book are discussed the basic problems of conducting mining operations during the construction of underground installations. There are 97 references, 72 of which are Soviet.

TABLE OF CONTENTS [abridged]

- Ch. I. Basic methods of conducting mining operations during construction of underground chambers -- 9
- Ch. II. Foreign experience in conducting mining operations during construction of underground chambers -- 22
- Ch. III. Drilling boreholes and blast holes -- 55

- Ch. IV. Blasting operations -- 83
- Ch. V. Mechanization of underground loading and transportation operations -- 118
- Ch. VI. Progressive methods of reinforcing mining excavations -- 145
- Ch. VII. Methods of excavating underground chambers in hard rocks -- 175
- Ch. VIII. Excavation methods providing for chamber-wall reinforcement during the excavation of a massif -- 178
- Ch. IX. Excavation methods by which chamber walls remain open during excavation -- 224
- Ch. X. Examples of calculations relative to work organization and the selection of equipment -- 233
- Ch. XI. Ventilation and dust suppression during the excavation of underground chambers -- 249
- Ch. XII. Several problems of underground installation stability -- 280
